

In large rural areas like the Island of Hawaii (big island). The only hope of broadband internet access outside of the few large towns is wireless. Imposing a TAX and massive paper work on potential ISPs could seriously hurt or stop the deployment of this technology. It is my understanding that the universal access fee is to make services available to those that would not otherwise have it. Well taxing wireless broadband will make it unavailable to those that would otherwise have it. That is counterproductive and leads to increase the gap between those that have broadband and those that don't in our society.
